Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (previously presented): An energy control apparatus for a vehicle having an internal combustion engine and a battery, comprising:

a turbocharger adapted to be coupled to said internal combustion engine;
an electric generator adapted to be coupled to said turbocharger and driven by exhaust gas from said internal combustion engine;

said electric generator adapted to be electrically connected to said battery; and
means for controlling power output of said electric generator for charging said battery or supplying power to electrical load in said vehicle while said engine is operational;

wherein said turbocharger has a controlled constant or variable outlet pressure by using said electric generator and said battery for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

2. (previously presented): An energy control apparatus for a vehicle having an internal combustion engine and a battery, comprising:

a turbocharger adapted to be coupled to said internal combustion engine;
an electric generator adapted to be mechanically driven by said turbocharger;
said electric generator adapted to be electrically connected to said battery; and
means for controlling power output of said electric generator for charging said battery or supplying power to electrical load in said vehicle while said engine is operational;

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

wherein said turbocharger has a controlled constant or variable outlet pressure by using the electric generator and battery for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

3. (previously presented): In a vehicle having an internal combustion engine and a battery, the improvement comprising:

- a turbocharger adapted to be coupled to said internal combustion engine;
- an electric generator adapted to be coupled to said turbocharger and driven by exhaust gas from said internal combustion engine;
- said electric generator adapted to be electrically connected to said battery; and
- means for controlling power output of said electric generator for charging said battery or supplying power to electrical load in said vehicle while said engine is operational;

wherein said turbocharger has a controlled constant or variable outlet pressure by using the electric generator and battery for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

4. (previously presented): In a vehicle having an internal combustion engine and a battery, the improvement comprising:

- a turbocharger adapted to be coupled to said internal combustion engine;
- an electric generator adapted to be mechanically driven by said turbocharger;
- said electric generator adapted to be electrically connected to said battery; and
- means for controlling power output of said electric generator for charging said battery or supplying power to electrical load in said vehicle while said engine is operational;

wherein said turbocharger has a controlled constant or variable outlet pressure by using the electric generator and battery for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

5. (previously presented): An energy control apparatus for a hybrid electric vehicle having an internal combustion engine, an electric motor, and a battery power supply, comprising:

a turbocharger adapted to be coupled to said internal combustion engine; and
an electric generator adapted to be mechanically coupled to said turbocharger and electrically connected to said battery power supply;

wherein said electric generator is configured to charge said battery power supply from power provided by said turbocharger; and

wherein said turbocharger has a controlled constant or variable outlet pressure for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

6. (original): An energy control apparatus as recited in claim 5, further comprising means for controlling power output of said electric generator for charging said battery power supply while said engine is operational.

7. (previously presented): An energy control apparatus as recited in claim 5, wherein said electric generator is adapted to be electrically connected to said motor and configured to supply at least partial power to said motor from power provided by said turbocharger.

Claims 8-11 (canceled)

12. (previously presented): An energy control apparatus as recited in claim 5, wherein said electric generator is adapted to be electrically connected to said motor and configured to supply at least partial power to said motor from power provided by said turbocharger.

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

13. (previously presented): An energy control apparatus for a hybrid electric vehicle having an internal combustion engine, an electric motor, and a battery power supply, comprising:

a turbocharger adapted to be coupled to said internal combustion engine; and
an electric generator adapted to be mechanically coupled to said turbocharger and electrically connected to said motor and to said battery power supply;

wherein said electric generator is configured to charge said battery power supply from power provided by said turbocharger; and

wherein said electric generator is configured to supply at least partial power to said motor from power provided by said turbocharger; and

wherein said turbocharger has a controlled constant or variable outlet pressure for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

14. (original): An energy control apparatus as recited in claim 13, further comprising means for controlling power output of said electric generator for charging said battery power supply while said engine is operational.

Claim 15 (canceled)

16. (previously presented): In a hybrid electric vehicle having an internal combustion engine, an electric motor and a battery power supply, the improvement comprising:

a turbocharger coupled to said internal combustion engine; and
an electric generator mechanically coupled to said turbocharger and electrically connected to said battery power supply;

wherein said electric generator is configured to charge said battery power supply from power provided by said turbocharger; and

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

wherein said turbocharger has a controlled constant or variable outlet pressure for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

17. (previously presented): An improvement as recited in claim 16, wherein said electric generator is electrically connected to said motor and configured to supply at least partial power to said motor from power provided by the said turbocharger.

18. (original): An improvement as recited in claim 16, further comprising means for controlling power output of said electric generator for charging said battery power supply while said engine is operational.

Claim 19 (canceled)

20. (previously presented): In a hybrid electric vehicle comprising an internal combustion engine, an electric motor and a battery power supply, the improvement comprising:

a turbocharger coupled to said internal combustion engine; and
means for charging said battery power supply from power provided by said turbocharger;

wherein said turbocharger has controlled constant or variable outlet pressure for altitude compensation, for controlling power output, or for both altitude compensation and controlling power output.

21. (original): An improvement as recited in claim 20, wherein said means comprises an electric generator mechanically coupled to said turbocharger and electrically connected to said battery power supply.

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

22. (previously presented): An improvement as recited in claim 20, wherein said electric generator is electrically connected to said motor and configured to supply at least partial power to said motor from power provided by said turbocharger.

23. (original): An improvement as recited in claim 21, further comprising means for controlling power output of said electric generator for charging said battery power supply while said engine is operational.

Claim 24 (canceled)

25. (previously presented): A hybrid electric vehicle, comprising:
an internal combustion engine;
an electric motor;
a battery power supply coupled to said electric motor;
a drivetrain configured to be coupled to said engine and said motor;
a turbocharger coupled to said internal combustion engine; and
means for charging said battery power supply from power provided by said turbocharger;

wherein said turbocharger has a controlled constant or variable outlet pressure for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

26. (original): A hybrid electric vehicle as recited in claim 25, wherein said means comprises an electric generator mechanically coupled to said turbocharger and to said battery power supply.

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

27. (previously presented): A hybrid electric vehicle as recited in claim 25, wherein said electric generator is electrically connected to said motor and configured to supply at least partial power to said motor from power provided by said turbocharger.

28. (previously presented): A hybrid electric vehicle as recited in claim 25, further comprising means for controlling power output of said electric generator for charging said battery power supply while said engine is operational.

Claim 29 (canceled)

30. (previously presented): A hybrid electric vehicle, comprising:
an internal combustion engine;
an electric motor;
a battery power supply coupled to said electric motor;
a drivetrain configured to be coupled to said engine and said motor;
a turbocharger coupled to said internal combustion engine; and
an electric generator mechanically coupled to said turbocharger and electrically connected to said battery power supply;
wherein said electric generator is configured to charge said battery power supply from power provided by said turbocharger;
wherein said turbocharger has a controlled constant or variable outlet pressure for altitude compensation, for controlling power output, or for both altitude compensation and controlling power output.

31. (original): A hybrid electric vehicle as recited in claim 30, further comprising means for controlling power output of said electric generator for charging said battery power supply while said engine is operational.

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

32. (previously presented): A hybrid electric vehicle as recited in claim 30, wherein said electric generator is electrically connected to said motor and configured to supply at least partial power to said motor from power provided by said turbocharger.

Claim 33 (canceled)

34. (previously presented): A hybrid electric vehicle, comprising:
an internal combustion engine;
an electric motor;
a battery power supply coupled to said electric motor;
a drivetrain configured to be coupled to said engine and said motor;
a turbocharger coupled to said internal combustion engine; and
an electric generator mechanically coupled to said turbocharger and electrically connected to said motor and to said battery power supply;
wherein said electric generator is configured to charge said battery power supply from power provided by said turbocharger; and
wherein said electric generator is configured to supply at least partial power to said motor from power provided by said turbocharger;
wherein said turbocharger has a controlled constant or variable outlet pressure for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

Claim 35 (canceled)

36. (previously presented): A hybrid electric vehicle as recited in claim 34, further comprising means for controlling power output of said electric generator for charging said battery power supply while said engine is operation.

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

37. (previously presented): A power control method for a hybrid electric vehicle having an internal combustion engine, an electric motor, and a battery power supply, comprising:

- coupling a turbocharger to said internal combustion engine;
- coupling an electric generator to said turbocharger and to said battery power supply;
- using said turbocharger to compensate for power loss in said internal combustion engine; and
- charging said battery power supply from power provided by said turbocharger; wherein said turbocharger has a controlled constant or variable outlet pressure by using said electric generator and said battery for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

38. (previously presented): A method as recited in claim 37, further comprising powering said motor from said electric generator.

39. (previously presented): A power control method for a hybrid electric vehicle having an internal combustion engine, an electric motor, and a battery power supply, comprising:

- using a turbocharger to compensate for power loss in said internal combustion engine; and
- using power from said turbocharger to drive an electric generator configured for charging said battery power supply; wherein said turbocharger has a controlled constant or variable outlet pressure by using said electric generator and said battery for altitude compensation or for controlling power output, or for both altitude compensation and controlling power output.

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

electric generator ~~improve~~ improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

47. (previously presented): An improvement as recited in claim 16, wherein charging said battery power supply from power provided by said turbocharger improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

48. (previously presented): An improvement as recited in claim 20, wherein charging said battery power supply from power provided by said turbocharger improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

49. (previously presented): A hybrid electric vehicle as recited in claim 25, wherein charging said battery power supply from power provided by said turbocharger improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

50. (previously presented): A hybrid electric vehicle as recited in claim 30, wherein charging said battery power supply from power provided by said turbocharger improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

51. (previously presented): A hybrid electric vehicle as recited in claim 34, wherein charging said battery power supply from power provided by said turbocharger improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

52. (previously presented): A method as recited in claim 37, wherein using power from said turbocharger to drive a generator configured for charging said battery

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

40. (original): A method as recited in claim 39, further comprising powering said motor from said generator.

41. (currently amended): An apparatus as recited in claim 1, wherein driving said electric generator with said turbocharger and charging said battery with said electric generator ~~improve~~ improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

42. (currently amended): An apparatus as recited in claim 2, wherein driving said electric generator with said turbocharger and charging said battery with said electric generator ~~improve~~ improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

43. (previously presented): An apparatus as recited in claim 5, wherein charging said battery power supply from power provided by said turbocharger improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

44. (previously presented): An apparatus as recited in claim 13, wherein charging said battery power supply from power provided by said turbocharger improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

45. (currently amended): An improvement as recited in claim 3, wherein driving said electric generator with said turbocharger and charging said battery with said electric generator ~~improve~~ improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

46. (currently amended): An improvement as recited in claim 4, wherein driving said electric generator with said turbocharger and charging said battery with said

Appl. No.: 10/660,371
Amdt. Dated: 06/13/2005
Allowed: 04/12/2005

power supply improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.

53. (previously presented): A method as recited in claim 39, wherein charging said battery power supply from power provided by said turbocharger improves volumetric efficiency and effective thermal efficiency of said internal combustion engine.
